Customer No. 22,852

Attorney Docket No. 08875.0005-02000

<u>AMENDMENTS TO THE CLAIMS</u>:

This listing of claims will replace all prior versions and listings of claims in the

application:

Claims 1-36 (withdrawn)

37. (Amended) A coating method for selectively applying a coating to surfaces

of [an object]a stent, the method applying the coating based upon optical properties of

the surfaces such that the coating is applied to surfaces of [a first type]the stent and is

not applied to surfaces of a [second type]balloon portion of a catheter on which the stent

is mounted, the [first type of surface] surfaces of the stent being optically distinguishable

from the [second type of surface] surfaces of the balloon portion of the catheter, the

coating [device]method comprising:

(a) generating relative movement between the [object]stent and at least one

optical scanning device and at least one coating applicator;

(b) optically scanning at least a portion of the [object]stent by use of said at

least one optical scanning device so as to produce output indicative of the different

types of surfaces of the [object]stent and balloon portion of the catheter;

(c) responding to said output by selectively activating said coating applicator,

thereby applying the coating substantially only to surfaces of the [first type] stent.

3

PATENT Customer No. 22,852 Attorney Docket No. 08875.0005-02000

- 38. (Pending) The coating method of claim 37, wherein said relative movement includes rotating the object about an axis perpendicular to a direction of application of said coating applicator.
- 39. (Pending) The coating method of claim 37, further comprising simultaneously supporting the object at two different regions along a length of the object.
- 40. (Pending) The coating method of claim 37, wherein said selective activation includes selectively activating a pressure-pulse actuated drop-ejection system with at least one nozzle.
- 41. (Pending) The coating method of claim 37, wherein said selective activation includes selectively activating a pressure-pulse actuated drop-ejection system with at least one nozzle that is included in a removable sub-housing, said removable sub-housing further including a fluid delivery system in fluid communication so as to supply coating material to said coating applicator.
- 42. (Amended) The coating method of claim 37, wherein said applying is [preformed] <u>performed</u> by selectively activating one of a plurality of coating applicators, wherein said at least one coating applicator implemented as said plurality of coating applicators, each of said plurality of coating applicators applying a different coating.
- 43. (Amended) The coating method of claim 42, wherein said applying is [preformed] <u>performed</u> by selectively activating, in sequence, said plurality of coating

applicators, thereby applying a plurality of layered coats, each one of said plurality of layered coats being of a coating material that is different from adjacent layered coats.

- 44. (Withdrawn)
- 45. (Pending) The coating method of claim 37, wherein responding to said output includes said output being indicative only of a surface of the first type thereby applying the coating to substantially the entire surface of the object.
- 46. (Pending) The coating method of claim 37, further comprising varying a spatial relationship between said coating applicator and the object.
- 47. (Pending) The coating method of claim 46, wherein said varying is along two axes, a first axis that is parallel to a direction of application of said coating applicator, and a second axis that is perpendicular to said direction of application of said coating applicator.
- 48. (Pending) The coating method of claim 47, wherein said varying is accomplished by displacing said coating applicator.
- 49. (Pending) The coating method of claim 48, wherein said varying is accomplished by varying the spatial relationship between said object and a displaceable applicator base upon which said at least one coating applicator and said at least one optical scanning device are deployed.
- 50. (Pending) The coating method of claim 49, wherein controlling said varying is accomplished by said processing unit.

PATENT Customer No. 22,852 Attorney Docket No. 08875.0005-02000

- 51. (Pending) The coating method of claim 37, further comprising responding to an indication of said relative motion so as to change operational parameters of the coating device as required.
- 52. (Amended) The coating method of claim 37, wherein generating relative movement, said optically scanning at least a portion of the object, and said selectively activating said coating are [preformed] performed within a housing.
